AMENDMENTS TO THE CLAIMS

(Currently Amended) A system comprising:

a bushing;

a button carrier disposed around within the bushing, the button carrier defining a slot;

a touch-sensitive input device coupled to the bushing and the button carrier, the bushing configured to support and isolate the touch-sensitive input device and to allow the touch-sensitive input device to move in a rotary degree of freedom;

an actuator configured to induce rotation of the touch-sensitive input device; and
a pin coupled to the touch-sensitive input device, the pin configured to engage with the
slot such that rotation of the touch-sensitive input device is limited by movement of the pin
within the slot.

- (Original) The system of claim 1, wherein the touch-sensitive input device comprises a touchpad.
- (Original) The system of claim 2, wherein the touchpad comprises a generally circular touchpad.
- 4. (Cancelled)
- (Original) The system of claim 1, wherein the touch-sensitive input device further comprises a magnet, and wherein the actuator comprises a magnetic core.
- 6. (Original) The system of claim 5, wherein the magnetic core comprises an E-core.
- 7. (Original) The system of claim 1, wherein the actuator comprises:

a motor; and

a drive belt driven by said motor and configured to produce the rotational force on the touch-sensitive input device.

- (Previously Presented) The system of claim 7, wherein the motor further comprises a
 pair of end stops to limit the rotation of the motor.
- 9. (Original) The system of claim 1, wherein the actuator comprises:

a motor; and

an eccentric rotating mass configured to impart a vibration on the touch-sensitive input device.

10. (Original) The system of claim 1, wherein the actuator comprises:

a motor; and

a flexure driven by said motor and configured to produce the rotational force on the touch-sensitive input device.

- 11. (Original) The system of claim 10, wherein the flexure comprises brass.
- (Original) The system of claim 1, further comprising a housing, wherein the actuator is grounded to the housing.
- 13. (Original) The system of claim 1, further comprising a processor configured to receive an output signal from the touch-sensitive input device and generate an input signal operable to cause the actuator to produce the rotational force.

14-19. (Cancelled)

- 20. (Previously Presented) The system of claim 1, wherein the actuator is configured to selfcenter based on a reluctance torque.
- 21. (Previously Presented) The system of claim 1, wherein the touch-sensitive input device defines a hole in its center and wherein the bushing is inserted into the hole from the underside of the touch-sensitive input device.
- (Previously Presented) The system of claim 1, wherein the slot has a length of approximately 2 millimeters.
- 23. (Previously Presented) The system of claim 1, wherein the button carrier comprises a button.
